TITLE:

Data on the Distribution of Scattered Elements in the Granitoids of Kazakhstan (Nekotoryye dannyye o raspredelenii rasseyannykh elementov v granitoidakh Kazakhstana)

PERIODICAL:

Byulleten' Moskovskogo obshchestva ispytateley prirody - Otdel geologicheskiy, 1958, Nr 2, pp 151-152 (USSR)

ABSTRACT:

The behavior of 16 additional elements has been studied in intrusive rocks of different-age complexes (Proterozoic - \(\chi_1 \), Ordovician - \(\chi_2 \), Lower Devonian - \(\chi_3 \), Middle Devonian - \(\chi_4 \), Early Hercynian - \(\chi_5 \)) of a region in Central Kazakhstan (Be, Sn, Mo, Zr, Ga, Pb, Cu, Zn, Co, Ni, Ti, Cr, V, Mn, Sr and Ba) The authors gives a detailed description of the various elements and states that their irregular distribution is due to tendencies connected with differentiation and hybridity phenomena,

TITLE:

The Flood of Tide in the Region of the Mirnyy Station

PERIODICAL:

Inform. byul. Sov. antarkt. ekspeditsii 1958, Nr 1, pp 73 - 78

ABSTRACT:

Observations by the "Valday" tide gauge mounted on the coast ice were carried out from November 22, 1956 to January 9, 1957. A site plan and the description of the tide gauge equipment are presented. The readings of the "Valday" device are compared with the readings of the pneumatic tide gauge of the "Shtorm" type. It is shown that the error owing to the sagging of the rope is very small for the "Valday" tide gauge. A series of 30 diurnal observations has been utilized for computing the harmonic constants of flood of tide. The processing is carried out by the Darwin method. The semidiurnal M_2 wave and the diurnal waves K_1 and O_1 have predominating significance; the amplitudes of all three waves are nearly equal. The results obtained are

Card 1/2

SOV/169-59-7-6840

The Flood of Tide in the Region of the Mirnyy Station

compared with the data from the "Gauss" expedition (1902), and the close connection between them is shown. The values of the cotidal hours obtained for the semidiurnal M_2 wave and the diurnal K_1 wave fit easily in the existing systems of the cotidal lines of the semidiurnal and diurnal tides of the Pacific Ocean. The nonharmonic constants are cited.

TITLE: Static deformation meter IN-4 with multi-position switch

Tr. Vses. n.-1. teplovozn. in-ta, vy*p. 12, 1961, 35-41

TOPIC TAGS: mechanical stress measurement, static deformation meter, IN-4,

machine part stress, tensometer

TRANSLATION: The IN-4 was designed and constructed for the measurement of stresses in machine parts; it has options of 44 or 51 switch positions. The range of stresses measured is ± 3200 kg/cm2. The basic circuit consists of a 4-branch bridge, two of whose branches are a working and a compensating wire tensometers. The two other branches have the form of two similar perallelwired contactless rheochords (balancing and measuring). The contactless is a flexible steel plate on either side of which are cemented wire tensometers. One end of the bar is rigidly fixed, and the other connected to a micrometer

Card 1/2

L 19345-63 ACCESSION NR: AR3005187

screw. The bending is measured with an accuracy of up to 0.01 mm. A change in tensometer resistance alters the bridge balance and current flows through the diagonal measuring path containing a galvanometer. The bridge is balanced by changing the bend in the rheochord.

ORG: none TITLE: School-seminar on power economy SOUNCE: Promyshlennaya energetika, no. 4, 1965, 48-49 TOPIC TAGS: electric energy, ventilation engineering ABSTRACT: In 1964 School-Seminars on the rational use of electrical and thermal energy in ventilation systems of coal pits and mines were held at the Anzherougol', Komerovougol', Osinnikiugol', Kuybyshevugol' trusts and the mining administration of Kuzbassonergo. These school-seminars were attended by 350 persons representing a complete cross section of the personnel involved -- from the chief engineers down to ordinary ventilation workers. Most losses were traced to poor design of ducts, air leakages, and poor maintenance. Seminars of this type are another example of the positive involvement of specialists in the struggle for a rational use of thermal and electrical power. [JPRS] SUB CODE: 10, 13 / SUBM DATE: none 1/1

QRS complex, frequently pronounced Q wave, etc.). It was revealed that H2S baths may influence the recovery processes in different ways. The change of the pathological condition for the worse was provoked by the H2S baths first of all when they were used in forced conditions (such as high concentration of HaS) and secondly in cases of increasing coronary deficiency by the administration of thyreoidin. In other cases HaS baths (not forced) aided in the abolition of certain signs of coronary deficiency. Changes, judging by the ECG, developed gradually during the use of H.S baths. These changes lasted only for a certain period of time and later were not characteristic for control experiments.

A description is given of the method of separating water solutions released by the soils. Fe in the form of oxide was carried eway along with the soil solutions from the upper to the lower horizons with the freezing of the turf-podzolic soil and its subsequent defrosting. Loss of Fe oxides and Al was not observed. In the thawing of the chernozem, water-soluble ferments, Ca, $\overline{\text{Mg}}$, HCO_3 , and PO_4 were detected in the released water solutions; the solutions given off from the solonetz contained watersoluble ferments, Ca, Mg, MCO3, PO4, and Cl. Na was also detected in the solonetz when prolonged wetting occurred in solutions before freezing. --S. R. Yesayan

AUTHORS:

Lipkes, Ya.M., Avertseva, K.N., and Koptseva, I.N.

TITLE:

Studying the character of the process of condensation of magnesium and magnesium chloride vapors formed during the vacuum separation of the reaction mass

SOURCE:

Akademiya nauk SSSR. Isetitut@metallurgii. Titan i yego splavy. no. 6, 1961. Metallotermiya i elektro-

khimiya, titana, 80 - 83

TEXT: The authors studied the process of vacuum separation under high residual pressures which make possible the condensation of Mg and MgOl2 vapors in order to try and find a way of both reducing the Mg loss and decreasing the condenser dimensions. According to D.S. Kamenetskaya (Ref. 1: Sb. Premeneniye vakuuma v metallurgii (Application of the Vacuum in Metallurgy) Izd. AN SSSR, 1958) and others, this process has to be conducted at a high temperature in the condenser zone -- with residual pressures in excess of the values corresponding to the triple-point readings: A vapor-tension of Oard 1/3

S/598/61/000/006/011/034 D228/D303

Studying the character of the

2.5 mm for Mg and 0.5 mm for MgCl₂, and a temperature of 651° for Mg and 722° for MgCl₂. The work was carried out in a laboratory apparatus with upper and lower condensers in the following stages: Insertion of the reaction mass in the upper or lower part of the retort; the evacuation of air down to a residual pressure of 10-2 mm; heating the reaction mass to 950°, followed by its scaking for a set period; Cooling the apparatus under an excess pressure of argon; And determination of Mg and Cl in the sponge to ascertain the degree of separation. The first series of experiments showed that the volumetric weight of the condensate in the apparatus with a lower condenser (0.9 - 1.3 g/cm³) is twice as great as is the case in the upper condenser. Under these conditions MgCl₂ occurs in the liquid phase while Mg is in the solid phase, since it has a capillary connexion with the Ti sponge. Further tests with material containing 44 % Ti, 36 % MgCl₂, and 20 % Mg -- conducted under a residual argon pressure of 10 - 15 mm, and at a temperature of 950° in the separation zone and 50° in the condensation zone -- gave a heavier condensate (1.2 - 1.4 g/cm³) in which liquid Mg had originally been present. Still denser material (1.4 - 1.5 g/cm³) was sub-Card 2/3

khimiya titana, 84 - 87

TEXT: The authors point out the undesirable effects of water and HCl vapors in the vacuum separation of the reaction products of magnesiothermal reduction of TiCl₄. HCl vapors can be effectively removed by a freeqing type using liquid N₂, but this has disadvantages in practice. Accordingly, the following possible absorbents were tested by drawing through HCl vapor with a control traps of liquid N₂; Ca, Mg oxides, MgCl₂, Ca, solid NaOH, silica-gel, activated charcoal, Ti powder, heated to 800°C. Satisfactory absorption was observed with (1) a mixture of activated charcoal and Ti rowder was observed with (1) a mixture of activated charcoal and Ti powder heated to 800°C and (2) a mixture of solid NaOH and Ti powder (800 OC). There are 1 figure and 3 tables. Card 1/1
